Prvi izveštaj 1990

... they are certain that emissions resulting from **human activities are substantially increasing** the atmospheric concentrations of the greenhouse gases, resulting on average in an **additional warming of the Earth's surface**. They calculate with confidence that **CO₂** has been **responsible for over half** the enhanced greenhouse effect. They predict that under a "**business as usual**" (BAU) scenario, global mean temperature will increase by about **0.3 °C per decade during** the [21st] century. They judge that global mean surface air temperature has increased by 0.3 to 0.6 °C over the last 100 years ...

Član 2

- (a) Holding the increase in the global average temperature to well below 2°C above pre-industrial levels and pursuing efforts to limit the temperature increase to 1.5°C above pre-industrial levels, recognizing that this would significantly reduce the risks and impacts of climate change;

Length shows strength of connection

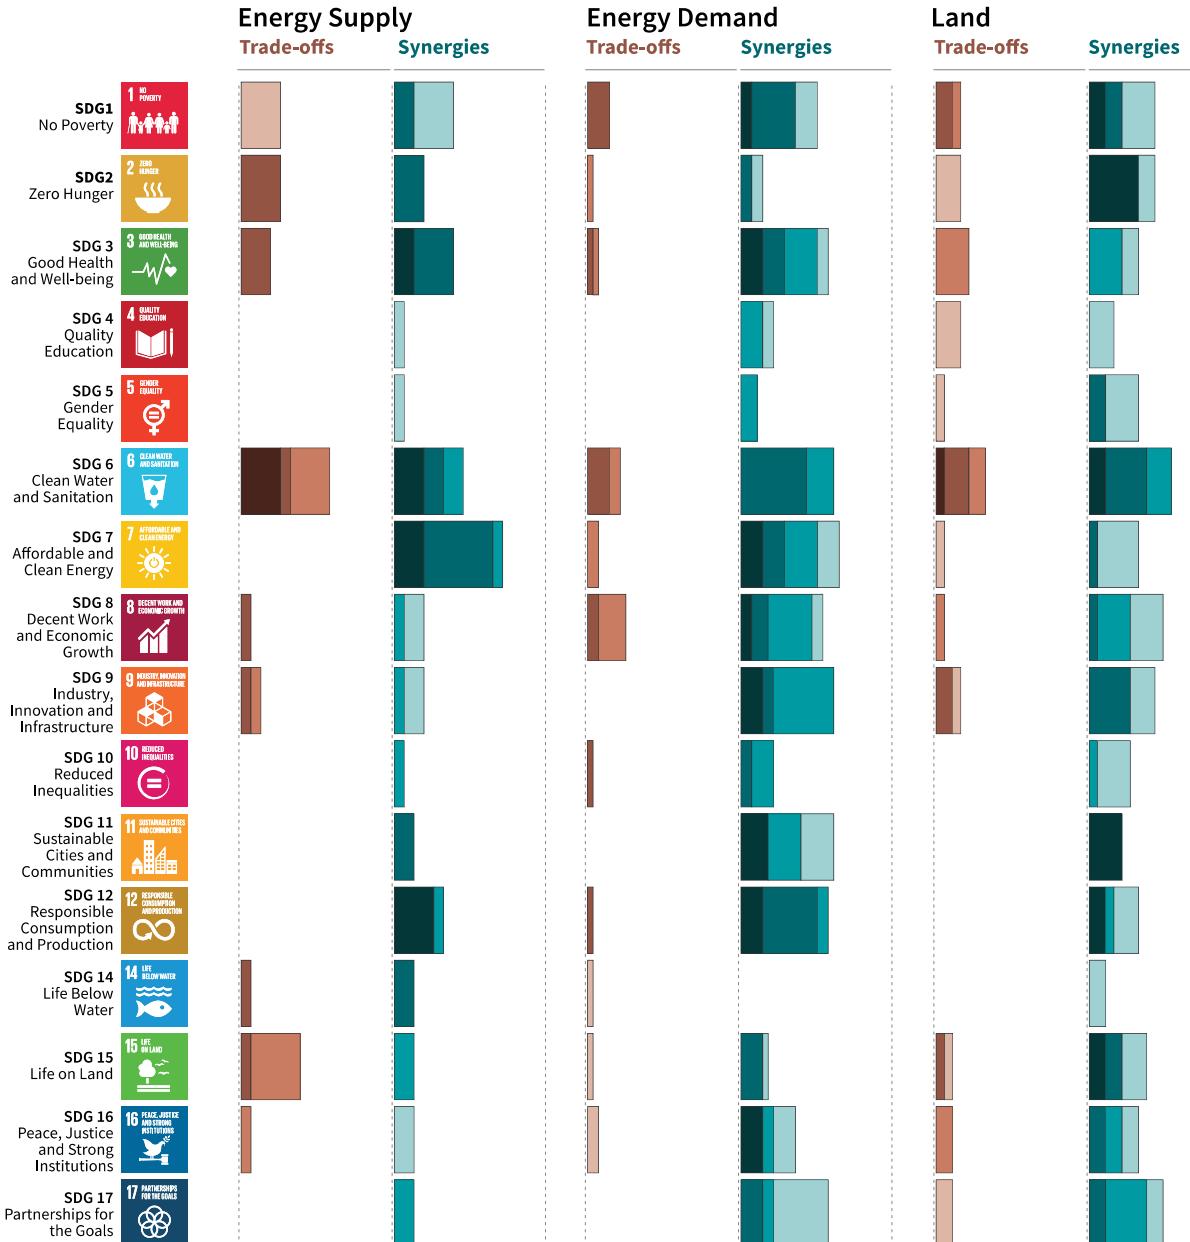

The overall size of the coloured bars depict the relative potential for synergies and trade-offs between the sectoral mitigation options and the SDGs.

Shades show level of confidence

The shades depict the level of confidence of the assessed potential for Trade-offs/Synergies.
